PORTFOLIO PERFORMANCE REPORT

Vikram
May 1 - August 2, 2026

EXECUTIVE SUMMARY

This corrected report rebuilds the portfolio from every filled order, the trading journal, the supplied 2 August positions, and daily historical closing prices. It carries forward the prior report's stated 30 April equity of $131,800 as the opening balance.

The true quarter was not a full recovery. May was very strong, followed by a steep June drawdown and another decline through July. The late-July reallocation produced a short rebound from the low, but the portfolio ended below both the May opening value and the June peak.

Key Results:

- Closing equity: $116,401 on 2 August (31 July market close), a $-15,399 change (-11.7%) from 1 May.
- Peak equity: $161,053 on 2 June; low: $109,696 on 29 July, a -31.9% peak-to-trough drawdown.
- Late-July rebound: +$6,705 (6.1%) from the low; the ending value was still -27.7% below the peak.
- Current holdings: $110,402 across 13 positions, plus $5,999 cash; current unrealized P&L; is +$5,828.
- The ledger contains 37 filled orders during the period, plus $27.06 of recorded dividends.

INVESTMENT STRATEGY

The portfolio is a long-only, growth-oriented equity strategy. Its current exposure is led by clean energy and technology, with fintech, healthcare and a defensive holding. The principal risk is concentration: clean energy alone represents roughly two-fifths of total equity.

- Growth themes: clean energy, AI/technology and fintech
- Medium-term holding periods with rebalancing through individual stock decisions
- Risk lesson: high-conviction positions require documented thesis checks and a fixed review cadence

MONTHLY PERFORMANCE BREAKDOWN

May (May 1 - May 29)

Strong rally and active rotation

The portfolio began May with 10 carried holdings: BE, BLDP, PLUG, AFRM, MDGL, DAL, V, GOOG, TSLA and XYZ. Their 1 May market value was $131,581, with $219 cash, reconciling to the $131,800 opening equity. May ended at $159,451, up $27,651 (21.0%). Purchases ($49,534) and sales ($49,482) were nearly matched, so this was primarily a rotation rather than a cash-raising month.

What was sold, bought and rebalanced:

- 8 May: sold all 27.85 TSLA shares at $420.03 (+$1,397 realized) and all 143.32 DAL shares at $73.32 (+$510); bought 73.74 PLTR at $135.59 and added 160.31 XYZ at $74.79.
- 13-15 May: closed the new PLTR trade at a $416 loss; rebought 22.10 TSLA shares and then sold them, a $395 loss. Net TSLA realized P&L; for May remained +$1,002.
- 21-22 May: sold all V shares essentially flat (+$1), bought 21 AMD shares, and added 21.97 GOOG shares to the existing holding.
- Best May market performer among the material carried holdings: BLDP, +85.5% in price from $3.39 to $6.29. Its large existing position made it the main contributor to the May rally.

The files record the executions but not a written thesis for each trade. The report therefore describes the observable rotation from DAL/V/TSLA into XYZ, AMD and GOOG rather than inventing a reason after the fact.

June (May 29 - June 30)

Drawdown, trims and cash raised

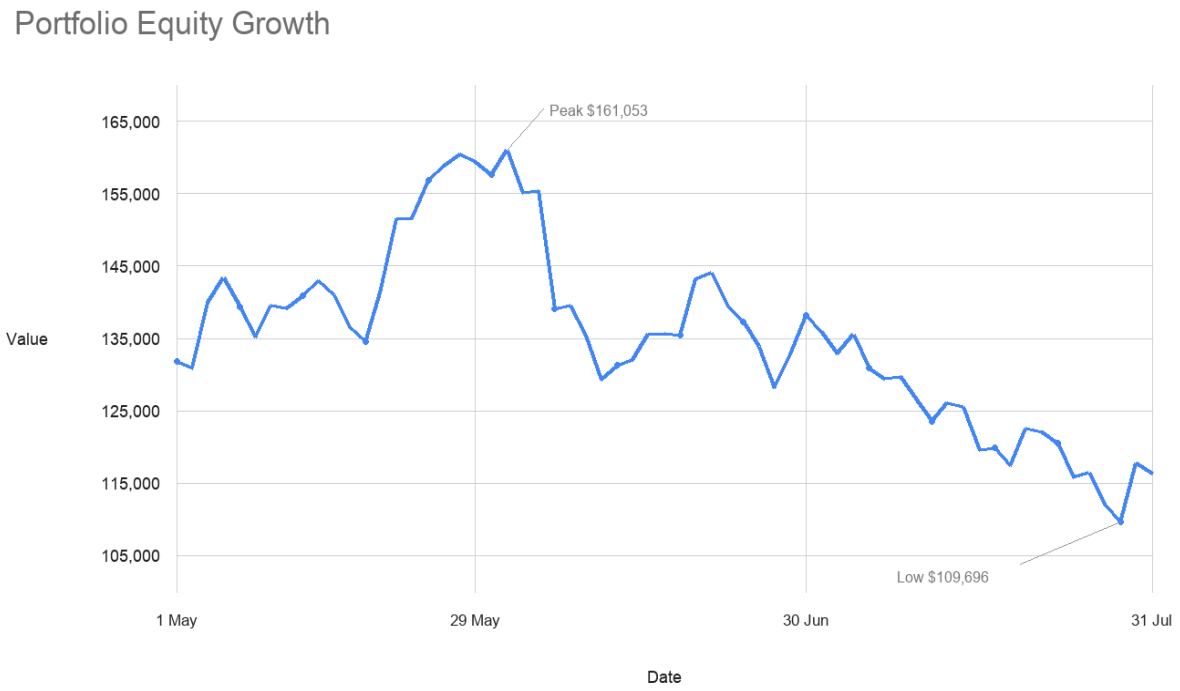

Equity fell from $159,451 to $138,224, down $21,227 (-13.3%). The portfolio sold $83,085 and bought $59,965, raising $23,121 of net cash. The $27.06 of recorded dividends is included in the calculation.

- 1 June: exited the full GOOG position, realizing a $169 loss.
- 2 June: fully exited XYZ through five back-to-back market orders (three sales and two purchases); it ended with zero shares and a +$1,461 realized result. Bought 41.84 NVDA shares and 30 AAPL shares.
- 5 June: added RKLB, ALAB, PLTR and NET. Trimmed 946.37 PLUG shares (19.5% of the original position; +$1,297 realized) and 1,818.18 BLDP shares (24.9%; +$4,127 realized).
- 9 June: sold all 21 AMD shares, realizing a $100 gain. There were 49 calendar days between this fill and the next filled order on 28 July.
- Key market pressure: BLDP fell 38.3% and PLUG fell 31.2% during June. ALAB was the strongest June price mover after entry (+50.9%), but its small size did not offset the broader drawdown.

JULY - AUGUST 2

Equity declined from $138,224 to $116,401, down $21,822 (-15.8%). As a recovery rebalancing, all RKLB was sold on 28 July at a $1,135 realized loss and all ALAB at a $375 realized loss. The proceeds, plus cash, were redeployed into MSFT ($7,995), BRK.B ($3,998), AMZN ($2,997) and AVGO ($4,998) to broaden the portfolio beyond the smaller growth names.

The reallocation was followed by a $6,705 (6.1%) move from the 29 July low to the 31 July close. This was a meaningful partial recovery, not a complete recovery of the June/July loss.

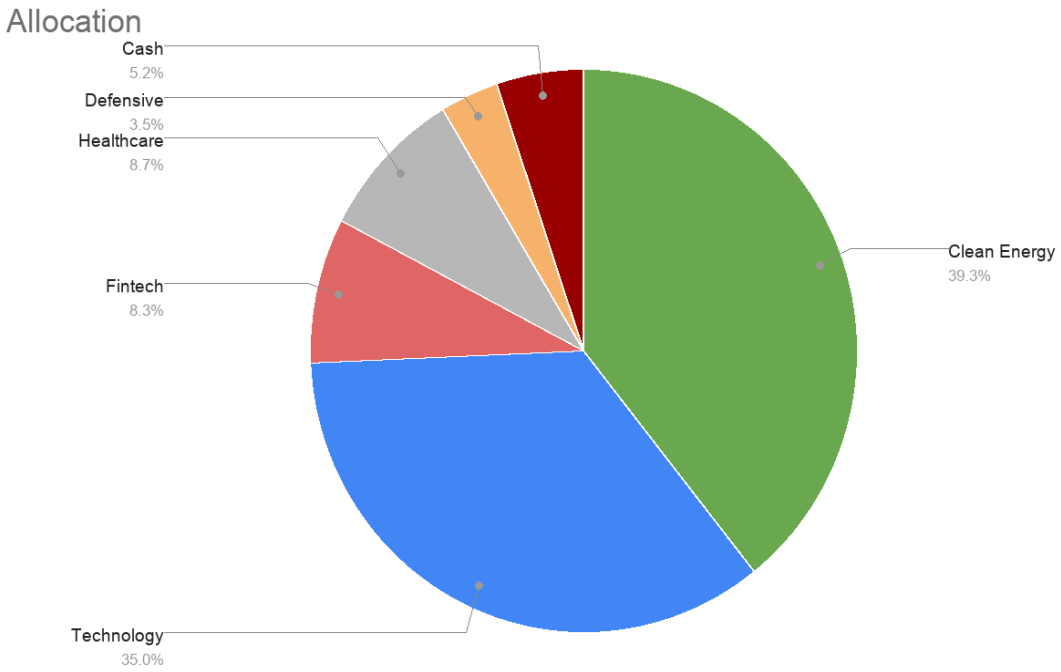

Corrected daily end-of-day equity: prior-report opening balance, actual fill prices, recorded dividends and Nasdaq historical daily closes. 2 August was a Sunday, so the chart ends at the 31 July close.

CORRECTED EQUITY GROWTH

The corrected curve rises from $131,800 on 1 May to a $161,053 peak on 2 June, then falls sharply through June and July. The low was $109,696 on 29 July; the final mark was $116,401. The market value at that final point ($110,402.43) reconciles to the supplied positions within one cent.

This is a calculated end-of-day portfolio valuation, not a broker-exported account-equity series. It uses official historical closing prices to mark the actual quantity held each day, actual execution prices for buys and sales, and the two dividends recorded in the trading journal. It does not claim intraday precision or include unrecorded cash events.

Allocation uses the supplied 2 August position marks and the calculated cash balance of $5,999. 2 August was a non-trading day; positions are marked at 31 July close.

KEY DECISIONS

- **May rotation:** exited DAL and V, traded TSLA and PLTR, and added XYZ, AMD and GOOG. The decision record shows a reallocation of capital, not a reduction in market exposure.
- **June trimming:** exited GOOG, XYZ and AMD; trimmed BLDP and PLUG; and added NVDA, AAPL, RKLB, ALAB, PLTR and NET. The BLDP and PLUG trims locked in the two largest realized gains of the period.
- **Late-July rebuild:** exited RKLB and ALAB after losses, then bought MSFT, BRK.B, AMZN and AVGO. The journal also records protective stop prices on the new positions, improving the risk-control process.
- **Current leaders:** BE +$3,000 (+15.0%), AFRM +$1,711 (+21.4%), MSFT +$1,351 (+16.9%) and PLUG +$823 (+11.4%).
- **Current positions needing review:** NVDA -$1,042 (-11.0%), PLTR -$403 (-12.3%) and BLDP -$385 (-2.6%).

Clean energy and technology together account for roughly three-quarters of equity. That can make the portfolio powerful when the themes work, but it also means risk must be controlled at the position and sector level.

LESSONS LEARNED

- **Main mistake: I left the portfolio largely unattended in June.** The journal shows 49 calendar days between the 9 June and 28 July fills. This did not cause every price decline, but it removed the chance to reassess positions and act sooner as the drawdown grew.
- **The timing of a recovery matters.** Trimming BLDP and PLUG realized gains, while the 28 July sales of RKLB and ALAB stopped additional exposure. The new purchases led to a small rebound, but the data shows that it did not fully recover the drawdown.
- **Write down the reason for every trade.** The ledger shows what was bought and sold, but often not why. A brief thesis, catalyst, invalidation point and target weight would make future reviews more disciplined.
- **Manage concentration deliberately.** Current clean-energy exposure is about 39% of the portfolio, and BE alone is the largest individual position. High conviction needs explicit size limits and a clear sell/review rule.

FOCUS FOR NEXT QUARTER

- Review the portfolio every week: price change, news, thesis, position size, cash and risk limits.
- Record an entry thesis, risk limit and exit condition before buying each stock; update the note when trimming or selling.
- Set a maximum individual-position and sector allocation, with a mandatory review once either threshold is exceeded.
- Export and review an equity curve weekly so a drawdown is visible before it becomes a multi-week problem.
- Use the cash balance intentionally: compare every new purchase with the risk/reward of the holdings it may replace.

CONCLUSION

The corrected record shows a strong May followed by a substantial June/July drawdown. The late-July reallocation was a constructive response and produced a partial bounce, but the most important outcome is procedural: active portfolio management requires regular monitoring, documented decisions and pre-defined risk controls. These practices will make the next recovery faster and the next drawdown easier to manage.

Data basis: supplied order history, current positions and trading journal; the attached prior report for the $131,800 opening equity; and Nasdaq daily historical close data for daily marks. Dollar amounts are USD and rounded in prose.
